

## Appendix B

# Module catalogue

for the bachelor's degree study programme in  
Mechanical Engineering (part-time combined studies)  
of the Faculty of Engineering and Mathematics

## Table of contents

|   |    |
|---|----|
| General Didactics and Orientation Practical.....                    | 14 |
| Bachelor Thesis .....   | 16 |
| Calculation and Simulation Technology in Industrial Production..... | 17 |
| Vocational Education I and Vocational Field Practical.....          | 19 |
| Vocational Education II.....  | 20 |
| CAD .....   | 21 |
| Diagnosis and Support.....  | 22 |
| Production Engineering I.....                                       | 24 |
| Production Engineering II .....                                     | 26 |
| Plastics Production Process .....                                   | 28 |
| Fundamentals of Electrical Engineering.....                         | 30 |
| Fundamentals of Industrial Computer Science.....                    | 31 |
| Fundamentals of Mechanical Process Engineering .....                | 33 |
| Industrial Management.....  | 35 |
| Industrial Control Technology.....                                  | 36 |
| Innovation Techniques .....   | 38 |
| Colloquium.....   | 40 |
| Designing with Plastics .....                                       | 41 |
| Construction Elements I.....  | 42 |
| Construction Elements II.....                                       | 44 |
| Lightweight Materials.....  | 46 |
| Mathematics I.....  | 47 |
| Mathematics II.....   | 48 |
| Mathematics III .....   | 49 |
| Measurement and Control Technology.....                             | 50 |
| Physics.....  | 51 |
| Product Risk Management.....  | 53 |
| Production Automation and Digitalisation .....                      | 54 |
| Production Management and Factory Organisation .....                | 56 |
| Project Management.....   | 57 |
| Quality Management .....  | 59 |
| Rapid Prototyping / Additive Manufacturing .....                    | 61 |
| Fluid Mechanics and Flow Machines .....                             | 62 |
| Didactics of Technology.....  | 64 |
| Technical Documentation.....  | 65 |
| Engineering Mechanics I.....  | 67 |
| Engineering Mechanics II.....                                       | 68 |

Module catalogue for the bachelor's degree study programme in  
Mechanical Engineering (part-time combined studies)

|                                 |    |
|---------------------------------|----|
| Engineering Mechanics III ..... | 70 |
| Technical English .....         | 71 |
| Thermodynamics .....            | 72 |
| Elective Project.....           | 74 |
| Plastics Engineering .....      | 75 |
| Metal Engineering .....         | 76 |

| 2                      | Learning outcomes/competences:<br>After successfully completing the bachelor thesis, students are able to independently work on and present a practice-oriented task from their subject area, both in the subject-specific details and in the interdisciplinary contexts, using scientific methods within a specified period of time.   |   |                 |                        |  |    |            |   |
| 3                      | Contents:<br>The bachelor thesis is an independent scientific work from the subject area of the respective study programme with a description and explanation of its solution. It can be derived from current research projects at the university or from operational problems with an engineering character. It can also be carried out through an empirical investigation or through conceptual or design tasks or through an evaluation of existing sources. A combination of these is possible. |   |                 |                        |  |    |            |   |
| 4                      | Forms of teaching:<br>Written composition with faculty tutoring   |   |                 |                        |  |    |            |   |
| 5                      | Participation requirements:   |   |                 |                        |  |    |            |   |
|                        | Formal:   | -   |                 |                        |  |    |            |   |
|                        | Content:  | Coordinated topic from the student's special subject area |                 |                        |  |    |            |   |
| 6                      | Forms of assessment:<br>Bachelor thesis   |   |                 |                        |  |    |            |   |
| 7                      | Prerequisite for the award of credit points:<br>Module examination pass   |   |                 |                        |  |    |            |   |
| 8                      | Application of the module (in the following study programmes)<br>Electrical Engineering (part-time combined studies) (B.Eng.); Mechanical Engineering (part-time combined studies) (B.Eng.);  |   |                 |                        |  |    |            |   |
| 9                      | Importance of the grade for the final grade:<br>Percentage based on the sum of credits of the graded modules according to RPO- BA §32   |   |                 |                        |  |    |            |   |
| 10                     | Module Officer:<br>Prof. Dr.-Ing. Michael Fahrig  |   |                 |                        |  |    |            |   |
| 11                     | Other information:<br>-   |   |                 |                        |  |    |            |   |

|                           | <p>The students gain an in-depth insight into individual manufacturing technology processes, in particular forming technology and machining manufacturing processes. Current trends in research and development will be addressed. To understand the influence of the equipment used, machine types and application areas of machine tools are presented. The necessary degree of automation is explained in relation to the requirements for productivity and flexibility using practical examples (flexible production cells, machining centres, etc.). In addition, students are taught basic knowledge for solving the diverse planning tasks in production, especially in a production planning.</p> <ol style="list-style-type: none"> <li>Machine tools for manufacturing <ul style="list-style-type: none"> <li>Overview - Structure - Requirements</li> </ul> </li> <li>Advanced Forming Manufacturing Processes <ul style="list-style-type: none"> <li>Calculation methods - machine/plant technology</li> </ul> </li> <li>Specialisation in machining processes <ul style="list-style-type: none"> <li>Calculation methods - machine/plant technology</li> </ul> </li> <li>Production planning and control <ul style="list-style-type: none"> <li>Work preparation - Production planning - Production equipment planning - Inspection planning</li> <li>Investment planning - Method planning - Production control</li> </ul> </li> </ol> |                     |                 |                        |  |     |            |   |

| 2  | <p><b>Learning outcomes/competences:</b></p> <p>The students are able to reproduce the essence of process engineering and to classify and explain the most important basic operations of process engineering and especially of mechanical process engineering in the overall context.</p> <p>The students know the basic sequence of a process as a result of acting force fields, energy and mass flows and can characterise it. Furthermore, they can map processes for mixing, separating and agglomerating and comminuting substances/substance mixtures. The students can explain the different apparatus and machines for separating mixtures of substances (cyclone, filter, centrifuges). The students are able to dimension a centrifuge for a specific application and optimise the process parameters of a centrifuge in different applications. The students can describe the design and function of disc separators and decanters.</p>  |                     |                 |                        |  |      |            |   |         |   |          |   |

|  | <p>The module first provides an insight into the structure, business processes and set-up of a company. It deals with important topics of today's factory organisation.</p> <p>In the further course, students are taught the essential technology drivers behind the buzzword "Industry 4.0". Building on the technologies presented, an outlook is given on the production of the future as predicted by many experts. Real-life examples will be used to present aspects of this vision of the future that are already being implemented today.</p> <p>Fundamentals of production, especially in the context of automation<br/> Requirements of the factory/production for product automation<br/> Basic technologies 4.0<br/> 3D Printers - Cyber Physical System - Sensitive Robots - Human-Machine Interaction - Big Data - Cloud Computing - Real Time Enterprise - Vertical/Horizontal Integration - Digital Factory - Predictive Maintenance<br/> Concepts of the factory of the future<br/> Digital business processes - Production system - Decentralised coordination - Management processes - Open value chain - Flexible production - Global activities (Advanced Manufacturing, Industry 4.0, Intelligent Manufacturing, e- Factory,...)<br/> The human factor in digitalised industry<br/> Assistance systems<br/> Process monitoring as an essential component in the automation of networked production systems. Sensors, monitoring strategies through to teleservice<br/> "Resource-efficient production"<br/> Exemplary implementations in companies</p> <p>In the exercises, the methods are applied to industry-related tasks through the use of modern IT tools and through exercises in the InProSys learning factory, as well as supplemented with examples from industry and solution providers.</p> |                     |                 |                        |  |      |            |   |

| 2  | <p><b>Learning outcomes/competences:</b><br/>The students acquire a basic understanding of operational IT systems and applications for the control and management of production processes. They are able to apply and link this understanding in operational processes. In this context, they will also be able to apply the basic and factual knowledge they have acquired in a future-oriented manner in everyday business life. They can apply their knowledge of lean management and factory organisation in practice.</p> |                     |                 |                        |  |      |            |   |         |   |          |   |

| 2  | <b>Learning outcomes/competences:</b><br>The students know the common procedures with their advantages and disadvantages. They can classify and evaluate the use of these processes for industrial applications from an economic and technological point of view. After successful participation, the students are able to plan and evaluate the use of these processes for different industrial applications, taking into account the process-specific advantages and disadvantages as well as the manufacturing and material costs, and to compare their general use with the conventional processes with critical reflection. |                     |                 |                        |  |      |            |   |
| 3  | <b>Contents:</b><br>Overview of the current additive/generative processes, definition of stereolithography, selective laser sintering, fused layer processes, three-dimensional printing, layer laminate processes, etc.<br>Data generation and process chain, rapid prototyping, rapid tooling Integration of additive manufacturing in process chains, direct manufacturing<br>New value creation with additive manufacturing/Economic considerations/Quality aspects<br>The path to individual production   |                     |                 |                        |  |      |            |   |
