Abbreviations of the teaching forms:

L = lecture, ST = tuition in seminars, E = exercise, S = seminar,

P = practical, SSS = supervised self-study (all data in semester credit hours);

CP = credit points

W/S = winter/summer semester

Appendix B:

Module Catalogue

for the Research Master Data Science (M.Sc.)

Modules

Agile Research Project Management	. 14
Big Data Architectures	.16
Data Mining & Machine Learning	.18
Introduction to Data Science	. 20
Introduction to Applied Research	. 22
Social Implications of Data Science	. 25
Colloquium	.27
Artificial Intelligence	. 28
Master Thesis	30
Project Phase I	31
Project Phase II	33
Project Phase III	35
Project-Specific Compulsory Elective Module	37
Scientific Exchange	38

2	Learning	g outcomes/c	om	petences:								

- - Students are able to plan, organise and control projects (especially software development projects) in an agile research environment.
 - The students know methods of agile project management and can select, adapt and apply them to concrete projects and their contexts
 - Students will be able to apply procedures and tools for configuration management and testing of software in the context of operational software development
 - Students understand the specifics of research projects. In an accompanying group exercise, they applied the methods they have learned and gained experience with non-hierarchical teamwork and conflict resolution.

- Introduction to project management
 - Resources, time and content
 - o Project acquisition
 - Project planning
 - Effort estimate
 - o Gantcharts
 - Project organisation
 - o Project management
 - o Project completion
 - o Project review
- Project management
 - o Team composition
 - **Conflict Management**
 - Stakeholder management
- Special features of agile project management
 - o Differentiation from traditional project management
 - The Agile Manifesto
 - SCRUM, Extreme Programming, Rapid Prototyping
- Software project management
 - o Configuration management
 - Testing and testing procedures
- Special features of innovation, development and research projects
 - Decentralised decision-making structures

	 Consortia research, specially funded projects of the European
	Union
	Accompanying exercise:
	 Planning and implementation of a mini-software project in Python
	in group work
4	Forms of teaching:
	Lecture, exercise
5	Participation requirements:
	Formal:
	Content:
6	Forms of assessment:
	Term paper or oral examination
7	Prerequisite for the award of credit points:
	Module examination pass
8	Application of the module (in the following study programmes)
	Research Master Data Science (M.Sc.)
9	Importance of the grade for the final grade:
	according to MRPO
10	Module Officer:
	N. N.
11	Other information:
	Literature will be announced at the beginning of the course.
12	Language:
	German

	Supervis study	sed self-) students		0	SCH	0	h	0	h

- The students know the differences between central and distributed systems and can select the right system according to the respective application.
- Students are familiar with the implementation of parallel and distributed information systems and analysis methods for large, complex and volatile datasets.
- They are familiar with the Apache Hadoop/Spark ecosystem for managing, processing and distributing data in data science applications, know its essential components, and can select and apply the components required in a project in a targeted manner.
- They know the principles of NoSQL databases and their characteristics as document-oriented databases, key-value databases, graph databases and column-oriented databases.
- They distinguish between the different types of NoSQL databases based on their scope of application and assess when which type of NoSQL database should be used and apply it in practice.
- Students will be able to describe the information technology requirements that must be taken as a basis for handling large data science projects in the cloud.

- Introduction to Big Data Computing
- NoSQL databases
 - o CAP Theorem
 - o ACID vs. BASE
 - Key-value database (e.g. Redis)
 - Document-oriented database (e.g. MongoDB)
 - o Wide-column store (e.g. HBase)
 - o Graph database (e.g. Neo4J)
- Big Data Architectures
 - o Batch vs. online data processing
 - Lambda architecture
- The Apache Big Data Ecosystem
 - Batch data processing using the example of Hadoop (e.g. HDFS, YARN, MapReduce)
 - Online Data Processing using Spark as an example (e.g. Kafka, Spark Streaming)

	 The students have gained an overview of the scientific field of data scier and know a framework for classifying problems, algorithms, processes a procedures. They understand the importance of data for today's living and worki environment and know the job descriptions and tasks of a data scientis. Students understand the basic concepts of functional programming a can implement programmes with Python. They know important standar Python libraries and can operate JupyterNotebook as well as Pycharm. The students understand the most important terms and can apply the basic methods of descriptive statistics, probability calculation a inferential statistics, which they need as a basis for the other courses the Master's programme and for the successful completion of their project They use Python for statistical data analysis, have mastered the metimportant functions and are familiar with the most important libraries. 						orking entist. g and endard m. ly the n and ses of roject. most

- Students have a deep understanding of the applied scientific way of working. This includes choosing a research method, formulating research questions, researching literature, writing scientific texts and presenting the validated results.
- They have internalised the basic rules of academic writing and can apply them to a concrete question.
- They understand how the scientific community is structured and functions and can classify the purpose and value of organisations, events or activities. They know possible career paths and are able to set milestones for their individual path.
- They know how and where research funds can be obtained to finance their own research projects.
- They know ways to exploit research results
- The students have fundamentally dealt with the search for truth and are able to critically question their own findings.
- They have understood the basics of logic and can apply them to practical problems.

- Introduction to epistemology and science theory
 - o Empiricism and Rationalism
 - o Theories of truth
 - o What is science?
 - o Forms of science (explaining and understanding)
 - o Classification of Applied Research and Data Science
- Logic basics
 - o Propositional logic
 - o Argumentation logic
 - o Predicate logic
- Research methods and research design
 - Quantitative, qualitative, (normative), forms of inference (inductive, deductive, abductive) and fallacies (dogma, infinite regress, circular reasoning, naturalistic fallacy)
 - Research methods in applied research and data science
- Deriving research questions
 - Validability and falsifiability

- o Derive problems from practice
- Validation
 - Validation methods
 - o Critical reflection
- Scientific writing and presentation
 - Text quality
 - Text structure
 - Argument structure
 - Scientific formulation
 - Citation rules
 - Giving feedback (Writing Fellow concept)
- Research
- Literature databases and search engines
- Procedure for the literature search
- Reading scientific texts
- Internet: MOOCS and social media
 - o Publishing process
 - o Call for paper
 - Abstract phase
 - Submission
 - o Peer review process
 - o Open Access vs. Closed Access
- The scientific community
 - o Roles, organisations and forums
 - o Organisation of research in Germany and Europe
 - o Publication and exchange
 - o Research and development in industry
 - o Career paths in applied science
- Raise research funds
 - Funders
 - Research funds in Germany and Europe
 - o Tenders
 - Research applications
- Applied research: Exploitation of research results
 - o Gap between research and implementation
 - Copyright
 - o Property rights (patents, utility models, e.g.)
 - Exploitation within companies (start-ups, product development, internal marketing)
 - Exploitation outside companies (company formation, licences)
- Practical
 - o Research, presentation and discussion of scientific texts
 - Exercises and tasks on predicate logic (e.g. with ProLog)

- Students will be able to evaluate and critically reflect on the social impact, especially ethical implications, of their scientific work.
- They are sensitised to consider data protection and personal rights in their own work and to respect applicable law.
- They know the challenges of data exchange in the business environment and can derive possible solutions based on existing technology.
- The students are aware of the responsibility of the data scientist and the necessity of open discourse in democratic constitutional states.
- The students can lead ethical discussions on the topic of data science and classify and justify their own findings against the background.
- Students are aware of the effect of discrimination by machine learning and how it can be prevented.
- The students can independently research findings from the field of science and technology reflection, summarise them in a paper and present them.

- Ethical foundations
 - o What is a good action?
 - o Basic ethical theories (deontology, cosequentialism)
 - o Ethical dilemmas
- Ethical implications of artificial intelligence
 - o Programmers as ethical decision-makers
 - o Weak vs. strong AI
 - Anthropology of technology
- Data protection and personal rights
 - o Why data protection?
 - o Introduction to the law of personality
 - o Dilemma: Data value vs. data protection
 - Methods for anonymisation and pseudonymisation of data
 - GDPR
- Data protection in the context of companies

	 Data exchange between companies Data sovereignty Effects of digitalisation on the world of work and life Global networking or digital isolation Home office or full accessibility Participatory democracy or 'fake news' Empty production or the next economic miracle Data science and diversity Gender and racial profiling

- 2 Learning outcomes/competences:
 - The students have acquired the competence to transfer practical problems to the conceptual world of artificial intelligence and to solve them with the help of intelligent agents and the corresponding algorithms.
 - The students have understood the mathematical basics of the procedures and algorithms and can adapt them independently.
 - They know the advantages and disadvantages of different search and problem solving strategies and are able to independently select and apply suitable algorithms.
 - They can develop software agents for complex stochastic, nonpermanently observable (multi-agent) environments with Python.
 - They are able to apply reinforcement learning to real-world problems and understand its basic concepts such as discounting, temporal-difference learning, policies and value functions.
 - They have practised the scientific way of working (recognising, formulating and solving problems), improved their ability to abstract and train their communication skills through free speech in the group.

- Intelligent agents
 - Types of agents
 - o Properties of environments
- Problem solving
 - o Uninformed and Informed Search
 - Search procedure (e.g. A* search)
 - o Full and partial observability
 - o Searches based on real states and belief states
 - o Adversarial search
 - o Multi-agent environments and game trees
- Knowledge
 - o Knowledge representation for agents
 - o Ontology and semantic networks
- Reasoning and planning
 - o Inferences (Generalised Modus Ponens)
 - Planning graphs
 - Contingency plans

- Students are able to work independently, in a scientifically functional manner in the context of an application-oriented research project. They will be able to develop and acquire technical and methodological knowledge in the field of data science independently, also through exchange with other project staff and the partners. They have the ability to transfer and apply the theoretical knowledge of methods from the other courses of the master programme to new practical problems in order to assess the suitability of the application in a concrete case.
- Students are able to work in a multidisciplinary team, especially in an agile project environment. They receive regular feedback and suggestions for improvement from the project owner and can implement them directly.
- Students can develop and implement structured and team-oriented solutions for problems arising in the project context
- The students are able to independently prepare a scientific publication. They can process and structure their own quantitative results and relate them to the current state of research. They can select conferences according to the thematic focus and the valence
- The students can critically question and discuss results in the context of a scientific exchange. They can prepare their own research results for presentation and present and defend them in front of an academic audience.
- Students can prepare and present scientifically researched knowledge in the form of a presentation.

3 Contents:

- Project work
 - Development of practical, quantitative results through procedures and algorithms of Data Science
 - Write a written report on the results achieved. The paper should be written with a view to submission to a scientific conference and, in the best case, should also be submitted
- Project colloquium

Professional/scientific exchange of all students and the project owners on problems and questions from the projects, discussions of interim results. The

focus of the third phase is on the presentation of the intermediate results of the project and the defence in the subsequent discussion. Research seminar In this cross-semester course, various scientific methods and tools are prepared and presented. Students independently research a method or tool from their field of research and present it in such a way that other students can understand the content presented. Forms of teaching: Project, seminar and colloquium Participation requirements: 5 Formal: Modules: 2056 Project Phase II; Content: Modules: 2051 Introduction to Data Science; 2052 Introduction to Applied Research; Forms of assessment: Project work Prerequisite for the award of credit points: 7 Module examination pass Application of the module (in the following study programmes) 8 Research Master Data Science (M.Sc.) 2	Learning outcomes/competences:										
3	 The students can discuss with experts from the economy and know possible future job profiles. The students are able to summarise acquired knowledge compactly and to communicate it to others through presentation. Contents: Excursions (conferences, research institutions, trade fairs, companies, project meetings) once per semester in coordination with the project owner. The aim of the excursion is to exchange with the scientific community, to get to know the possible future working environment and to build up specific expertise. After the visit, the students summarise what they have learned in a short presentation and present this to the Project Owner.
